

Bubonic Plague (The Black Death)

man first gets bit by infected flea

bacteria travels to nearest lymph node/replicates and causes lymph node to swell and become painful/inflamed. This "spot" is called a bubo. You will first feel/get feelings of fever, headache, chills, and weakness

more often than not, this illness would not be treated, therefore allowing it to spread to other parts of your body

* can't breathe *

* coughs *

Along with the Black Death, there are complications such as the pneumonic plague. This gives you shortness of breath, chest pain, coughing, and bloody or watery mucus

This will most likely not be treated, often leading to death
