

# Sum color theory STUFF!

(tell me if something i say is wrong)

↑  
color wheel

\*\*There are many ways to make a color wheel, this is just one example i made with all of my colors

A color wheel is good for helping you make color palettes because it can show you differences in colors like hue, and help you have contrast.

## Hue:

Hue is the "color appearance" of a color. It's a hard word to explain, so here are some examples:

blue and teal      red and green  
have slightly      have very  
different hues      different hues

these three colors all have the same hue, though some are more saturated than others.

## Saturation:

Saturation is how bright or dull a color is. A color with high saturation will look bright, and a color with low saturation will look dull.

these colors have high saturation      these colors have low saturation

these colors all have the same saturation, though they are different hues.
