

it didn't work. It just keeps saying "Your network is blocking connection to our game servers. Get more details on how to fix this here"

Then this pops up on another website if I'm trying to fix it: Test Failed

WebSocket connection to *.gimkitconnect.com

What It Means

You won't be able to connect to our game servers. This will prevent you from hosting & participating in all game modes.

How To Fix

Unblock both of the following domains:

https://*.gimkitconnect.com

wss://*.gimkitconnect.com

Note that these are both wildcards. Gimkit needs access to every subdomain for both HTTP Requests & WebSockets on gimkitconnect.com to work properly.

If the firewall check test below passed, this is most likely an issue with your school's proxy network. Gimkit requires secure Websockets, which can cause issues with some proxy servers. You may need to allow *.gimkitconnect.com in your proxy's security settings. SSL is used to encrypt data between devices and servers. Networks that monitor SSL activity sometimes replace our certificates with those of the monitoring service. This can cause authentication errors. *.gimkitconnect.com may need to bypass network monitoring.
